Boosting Biodiversity

Normanhurst Court Caravan Club Site

As part of The Club's ongoing commitment to protecting and enhancing the natural environment on and around Club Sites, our Boosting Biodiversity programme aims to help members and Wardens get more from their surroundings. A rolling ecological appraisal of sites across The Club network, as part of the Boosting Biodiversity initiative, has included this site.

The Caravan Club is also implementing a Corporate Biodiversity Action Plan (CBAP), which sets objectives and actions for the conservation of biodiversity across the Sites network, and makes recommendations for encouraging and managing 20 species and habitats. You can play a part in our commitment to the environment, by using this Boosting Biodiversity Checklist to monitor the wildlife you see during your stay. Your findings will be invaluable in ensuring our sites maintain as diverse a habitat for wildlife as is practically possible, and will be included in the overall results collated as part of our CBAP obligations. We would also welcome records of additional species not included on the form, so space has been provided for these.

Please return the Checklist to your Wardens on departure.

The site was developed within what were formally the garden and grounds of a Victorian country mansion of the same name, built by Sir Henry Brassy, the railway magnate. Many of the fine, unusual and mature trees are survivors from those planted at the time and provide an increased level of biodiversity over the usual mixed Sussex woodland and pasture. Rabbits and grey squirrels are common and a wide variety of bird species can be seen. Britain's smallest bird, the Goldcrest, has been recorded here.

Please give your arrival and departure dates: / / to / /
